particular and patronismets

### GENERAL OBJECTO WW.READNIGERIANETWORK.COM

At the end of the series of courses in this syllabus, candidates should be able to:

describe the properties of matter and waves, and various physical phenomena at the microscopic and macroscopic levels;

analyse and apply Physics laws and principles to solve real life

problems;

design, implement and draw meaningful inferences from the results of experiments;

4. explain natural and physical phenomena using Physics laws and

concepts;

5. develop and enhance creativity in students in their day to day

activities; and

6. prepare students for further and higher studies in Physics and Physics related courses.

FIRST SEMESTER COURSES

PHY 001: MECHANICS AND PROPERTIES

(3 UNITS) **OF MATTER** 

PHY 002: HEAT, WAVES AND OPTICS (3 UNITS)

SECOND SEMESTER COURSES

PHY 003: ELECTRICITY AND MAGNETISM (3 UNITS) (3 UNITS) PHY 004: MODERN PHYSICS

### COURSE DESCRIPTION

### (3 Units) PHY 001: Mechanics And Properties Of Matter Specific Objectives

At the end of this course, candidates should be able to:

1. differentiate between fundamental physical quantities and derived quantities;

explain and apply the concept of dimensional analysis;

define and explain various physical laws in relation to mechanics;

describe the phases of matter;

describe and explain physical phenomena in relation to fluid mechanics; and

6. solve problems using the laws geprinciples and theories of mechanics.

Topics	Sub-Topics	Details and notes
Units	Order of Magnitude, Definition of Units: length, mass, time; Unit Conversion and Measurements, Methods of Measuring Length, Mass and Time. Basic and Derived Units, Dimensional Analysis (L, M, T only).	Revision of types of motion: translational, random, oscillatory, and rotational; Linear motion: distance, displacement, uniform velocity and uniform acceleration are required.  The following suggested experiments
Vectors	Vector Representation, Addition and Subtraction of Vectors (geometrical method only), Resolution of Vectors. Vector Multiplication, Vectors in Cartesian	will enhance the student's understanding of the topics covered in this course:  1. Error analysis and significant figures.  2. Measurement of velocity and acceleration.
Particle Kinematics	Coordinate System.  Types of Motion: translational, random, oscillatory, and rotational. Linear Motion: distance, displacement, uniform velocity motion, uniform acceleration motion, graphs of kinematic equations. Instantaneous and Average Velocity and Acceleration. Motion in two or three dimensions. Relative motion in one and two dimensions, Free Fall, Projectile Motion.	<ol> <li>Investigation on the proportionality of acceleration and force.</li> <li>Investigation of the relationship between period and length of simple pendulum and hence calculations of acceleration due to gravity (g).</li> <li>Verification of the principle of conservation of momentum.</li> <li>Investigation of the laws of equilibrium for a set of coplanar</li> </ol>
Dynamics	Newton's Laws of Motion, Types of Force, Newton's Universal Law of Gravitational, Equilibrium of Forces, Centre of Mass and Centre of Gravity, Moment of a Force, Linear Momentum and its Conservation Laws, Elastic and Inelastic	static and dynamic friction.

## PHY 002: Heat, Waves And Optics Specific Objectives

(3 Units)

At the end of this course, candidates should be able to:

1. explain the concept of ideal gas;

2. explain the concepts of heat, temperature and modes of heat transfer;

3. explain light as an electromagnetic phenomenon and identify the components of the electromagnetic spectrum;

4. locate by graphical means and by calculation the position of images formed by mirrors and lenses;

5. describe the operation of various optical instruments and their applications;

6. explain the dual nature of light – the particle nature and the wave nature:

7. explain the properties of light arising from its wave nature; and

8. explain the principles of sound propagation.

PHY 003: Electricity And Magnetism
Specific Objectives
At the end of this course, candidates should be able to:

state the fundamental laws in electricity and magnetism; state the fundamental laws in closes the electrostatic force and the explain the relationship between the electrostatic force and the

electric field;
3. explain the relationship between the magnetic force and the

magnetic neid;
4. describe and explain the interaction between the electric field and the magnetic field;

5. explain the effect of charges in motion;

6. describe and explain physical phenomena in electricity and

7. solve problems using the laws, principles and theories of electricity and magnetism; and

8. identify and describe some industrial applications of the electromagnetic theory.

PHY 004: Modern Physics Specific Objectives (3 Units)

At the end of this course, candidates should be able to:

- 1. describe the structure of the atom;
- 2. describe the structure of the atom and its energy spectrum;
- 3. explain the wave-particle duality of matter;
- 4. explain the limitation of Classical Physics;
- 5. describe the nature and properties of x-rays;
- 6. explain the interaction of radiation with matter;
- 7. explain radioactive disintegration and calculate radioactive decay constants of different radioactive elements; and
- 8. explain the concept of semi-conductors.
